Abstract

An endoprosthesis for replacing the ankle joint, comprising a lower component (4) which is to be connected to the ankle bone (2), an upper component (3) which is to be connected to the shin bone (1), and an intermediate part (5) which forms a slide joint both with the lower component and also the upper component. An intermediate part (5), which is wedge-shaped in sagittal section, is provided in order to compensate for anatomical or surgical irregularities. The upper component (3) can also be wedge-shaped in frontal section or sagittal section.
